REPAIR OF A URINARY VAGINAL FISTULA
Procedure Specific Information

What is the evidence base for this information?
This publication includes advice from consensus panels, the British Association of Urological Surgeons, the Department of Health and evidence-based sources. It is, therefore, a reflection of best urological practice in the UK. It is intended to supplement any advice you may already have been given by your GP or other healthcare professionals. Alternative treatments are outlined below and can be discussed in more detail with your Urologist or Specialist Nurse.

What does the procedure involve?
Surgical closure of an abnormal connection (resulting in a urinary leak) between the vagina and the bladder or ureter.

What are the alternatives to this procedure?
Urine diversion by bladder catheter/nephrostomy, ileal conduit urinary diversion, observation, very occasionally closure of the vagina (colpocleisis).

What should I expect before the procedure?
A pre-clerking appointment will also be sent to you to assess your general fitness, to screen for the carriage of MRSA and to perform some baseline investigations.

You will come into hospital on the day before surgery. After admission, you will be seen by members of the medical team which may include the Consultant, Specialist Registrar, House Officer, your named nurse and possibly a Urology Nurse Specialist. You will also be seen by the anaesthetist before the operation.

You will be given intravenous antibiotics at the time the anaesthetic is given, and possibly after surgery too.

You will be asked not to eat or drink for 6 hours before surgery and, immediately before the operation, you may be given a pre-medication by the anaesthetist which will make you dry-mouthed and pleasantly sleepy.

You will be given an injection under the skin of a drug (Clexane), that, along with the help of elasticated stockings provided by the ward, will help prevent thrombosis (clots) in the veins.
Please be sure to inform your surgeon in advance of your surgery if you have any of the following:

- an artificial heart valve
- a coronary artery stent
- a heart pacemaker or defibrillator
- an artificial joint
- an artificial blood vessel graft
- a neurosurgical shunt
- any other implanted foreign body
- a regular prescription for Warfarin, Aspirin or Clopidogrel (Plavix®)
- a previous or current MRSA infection
- a high risk of variant-CJD (if you have received a corneal transplant, a neurosurgical dural transplant or previous injections of human-derived growth hormone)

At some stage during the admission process, you will be asked to sign the second part of the consent form giving permission for your operation to take place, showing you understand what is to be done and confirming that you wish to proceed. Make sure that you are given the opportunity to discuss any concerns and to ask any questions you may still have before signing the form.

Fact File 1 • The NHS Constitution

Same-Sex Accommodation

As a result of the new NHS constitution, the NHS is committed to providing same-sex accommodation in hospitals by April 2010. This is because feedback from patients has shown that being in mixed-sex accommodation can compromise their privacy. The NHS pledges that:

- sleeping and washing areas for men and women will be provided
- the facilities will be easy to get to and not too far from patients’ beds

To help accomplish this, the Department of Health has announced specific measures designed to “all but eliminate mixed-sex accommodation” by 2010. These include:

- more money for improvements in hospital accommodation
- providing help and information to hospital staff, patients and the public
- sending improvement teams to hospitals that need extra support
- introducing measures so that the Department can see how hospitals are progressing

What happens during the procedure?

Normally, a full general anaesthetic will be used and you will be asleep throughout the procedure. In some patients, the anaesthetist may also use an epidural anaesthetic which
produces freedom from pain post-operatively.

If your surgeon has decided to close a bladder fistula from below, the procedure will be performed entirely through the vagina, following which a pack is usually left in place in the vagina.

Usually, an abdominal approach is necessary and the procedure will be performed through either a vertical or a transverse incision in your lower abdomen. The fistula is dissected out and the connection between the urinary tract and the vagina divided. It is usual to position part of the fatty envelope from inside the abdomen (the omentum) to prevent the fistula from recurring.

What happens immediately after the procedure?
In general terms, you should expect to be told how the procedure went and you should:

- ask if what was planned to be done was achieved
- let the medical staff know if you are in any discomfort
- ask what you can and cannot do
- feel free to ask any questions or discuss any concerns with the ward staff and members of the surgical team
- ensure that you are clear about what has been done and what is the next move

The average stay in hospital will last approximately 10-14 days.

Two catheters will probably be placed in the bladder for up to two to three weeks, one via the urethra and one (suprapubic catheter) via a small incision in the skin over the bladder. There will be a drainage tube close to the wound, to drain fluid away from the internal area where the operation has been done. A tube may be placed through the nose to drain the stomach.

After your operation, you may be in the Special Recovery area of the operating theatre before returning to the ward; visiting times in these areas are flexible and will depend on when you return from the operating theatre. You will have a drip in your arm.

You will be encouraged to mobilise as soon as possible after the operation because this encourages the bowel to begin working. We will start you on fluid drinks and food as soon as possible.

Normally, we use elastic stockings to minimise the risk of a blood clot (deep vein thrombosis) in your legs. A physiotherapist will come and show you some deep breathing and leg exercises, and you will sit out in a chair for a short time soon after your operation.

It will, however, take at least 6 months for you to recover fully from this surgery, although
much of the recovery comes a good deal sooner than this.

Are there any side-effects?
Most procedures have a potential for side-effects. You should be reassured that, although all these complications are well-recognised, the majority of patients do not suffer any problems after a urological procedure.

Common (greater than 1 in 10)
- Infection or hernia of the incision requiring further treatment
- Altered bladder function in the short- or long-term.

Occasional (between 1 in 10 and 1 in 50)
- Anaesthetic or cardiovascular problems possibly requiring intensive care admission (including chest infection, pulmonary embolus, stroke, deep vein thrombosis, heart attack and death)
- Blood loss requiring transfusions or repeat surgery
- Failure of the operation with leakage of urine through the vagina, requiring re-operation
- Scarring of the ureters requiring further surgery

Rare (less than 1 in 50)
- None

Hospital-acquired infection
- Colonisation with MRSA (0.9% - 1 in 110)
- Clostridium difficile bowel infection (0.2% - 1 in 500)
- MRSA bloodstream infection (0.08% - 1 in 1250)

The rates for hospital-acquired infection may be greater in high-risk patients e.g. with long-term drainage tubes, after removal of the bladder for cancer, after previous infections, after prolonged hospitalisation or after multiple admissions.

What should I expect when I get home?
By the time of your discharge from hospital, you should:

- be given advice about your recovery at home
- ask when to resume normal activities such as work, exercise, driving, housework and sexual intimacy
- ask for a contact number if you have any concerns once you return home
- ask when your follow-up will be and who will do this (the hospital or your GP)
- ensure that you know when you will be told the results of any tests done on tissues or organs which have been removed
When you leave hospital, you will be given a “draft” discharge summary of your admission. This holds important information about your inpatient stay and your operation. If you need to call your GP for any reason or to attend another hospital, please take this summary with you to allow the doctors to see details of your treatment. This is particularly important if you need to consult another doctor within a few days of your discharge.

You will require pain-killing tablets at home for two or three weeks and it may take two or three weeks at home to become comfortably mobile.

You may go home with one or both catheters still in place, and have a planned return to hospital for these to be removed. If so, you or your carers will be taught how to look after the catheters and the drainage systems for them.

You should avoid driving for at least six weeks, and it may be longer before this is possible.

If you work, you will need a minimum of six weeks off, and it may be significantly longer if your work involves physical activity.

Heavy lifting should be avoided for 6 weeks

Sexual intercourse should be avoided for at least a month.

You may see blood in the urine or vaginal discharge for up to a month after surgery.

**What else should I look out for?**

If you go home with catheters, you or your carers should check regularly to ensure that urine is draining via the catheters, which confirms that the catheters have not blocked. If the catheters both block this can put pressure on the suture line in the bladder, and so the catheters would need to be flushed and unblocked very promptly.

**Are there any other important points?**

The Urology Specialist Nurses will keep in contact by phone and by clinic visits in the first couple of months after surgery, and be available for long-term follow-up.

A follow-up outpatient appointment will be arranged at about 6-8 weeks after surgery.

**Driving after surgery**

It is your responsibility to ensure that you are fit to drive following your surgery. You do not normally need to notify the DVLA unless you have a medical condition that will last for longer than 3 months after your surgery and may affect your ability to drive. You should, however, check with your insurance company before returning to driving. Your doctors will be happy to provide you with advice on request.
Is there any research being carried out in this area?

Before your operation, your surgeon or Specialist Nurse will inform you about any relevant research studies taking place, and, in particular, if any surgically-removed tissue may be stored for future study. If this is the case, you will be asked if you wish to participate and, if you agree, to sign a special form to consent to this.

All surgical procedures, even those not currently the subject of active research, are subjected to rigorous clinical audit so that we can analyse our results and compare them with those of other surgeons. In this way, we can learn how to improve our techniques and our results; this means that our patients will get the best treatment available.

Who can I contact for more help or information?

For further information on the internet, here are some useful sites to explore:

www.rcseng.ac.uk/patient_information/internet_sources
www.patient.co.uk

What should I do with this information?

Thank you for taking the trouble to read this publication. If you wish to sign it and retain a copy for your own records, please do so below.

If you would like a copy of this publication to be filed in your hospital records for future reference, please let your Urologist or Specialist Nurse know. However, if you do agree to proceed with the scheduled procedure, you will be asked to sign a separate consent form which will be filed in your hospital record. You will, if you wish, be provided with a copy of this consent form.

I have read this publication and I accept the information it provides.

Signature............................................................... Date..........................................

...
How can I get information in alternative formats?
Please ask your local NHS Trust or PALS network if you require this information in other languages, large print, Braille or audio format.

Most hospitals are smoke-free. Smoking increases the severity of some urological conditions and increases the risk of post-operative complications. For advice on quitting, contact your GP or the NHS Smoking Helpline free on 0800 169 0 169

No responsibility for loss occasioned by any person acting or refraining from action as a result of the material in this publication can be accepted by the British Association of Urological Surgeons Limited.

Fact File 2 • The NHS Constitution
Patients’ Rights & Responsibilities

The constitution, as a result of extensive discussions with staff and the public, sets out new rights for patients which will help improve their experience within the NHS. These new rights include:

- a right to choice and a right to information that will help them make that choice
- a right to drugs and treatments approved by NICE when it is considered clinically appropriate
- a right to certain services such as an NHS dentist and access to recommended vaccinations
- the right that any official complaint will be properly and efficiently investigated, and that they be told the outcome of the investigations
- the right to compensation and an apology if they have been harmed by poor treatment

The constitution also lists patient responsibilities, including:

- providing accurate information about their health
- taking positive action to keep themselves and their family healthy
- trying to keep appointments
- treating NHS staff and other patients with respect
- following the course of treatment that they are given
- giving feedback, both positive and negative, after treatment
